Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 43413, Application US/09864761
Patent No. 1820202004876331
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Penn, Sharron C.
APPLICANT: Hancel, David R.
APPLICANT: Hancel, David R.
APPLICANT: Hancel, David R.
APPLICANT: Chew, Wentsheng
TITLE OF INVENTION: GENE EXPRESSION ANALYSIS BY MICROARRAY
TITLE OF INVENTION: GENE EXPRESSION ANALYSIS BY MICROARRAY
FILE REPRENCE: Accord.ca.×1.
CURRENT PALLICATION WUMBER: US 60/180,312
PRIOR APPLICATION WUMBER: US 60/207,456
PRIOR APPLICATION WUMBER: US 60/207,456

SwissProt_40:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The peptides represented in AAR13803-12 are examples of a generic formula. They are substrates for assaying factor Xa (an enzyme involved in haemostasis). Compared with known substrates they have better affinity, selectivity and/or water solubility.

                                                                                                                                                                                                                                                                                                                                                       R2=4-fitro for incompliants with the proviso that A3=Gly when A4=Lys and A3=Glyc when A4=Arg. The peptides are used as substrates for the quantitative determn. Of bacterial endotoxins e.g. in physiological fluids, food or pharmaceuticals. They have higher activity than the known substrate S-243 which has Gly-Arg as the C-terminal sequence. They are see also AAR12867-R12869.

```

```
The inventors claims a method for the preparation of a mature polypeptide which involves the enzymatic cleavage of a soluble precursor of the polypeptide using factor Xa. In particular the method is used for the preparation of mature human growth hormone. Eg, Factor Xa is immobilised on a solid insoluble support which is brought into contact with a soluble precursor of the polypeptide, hGH, which has the formula ARR27101-FAST. ARR27102 confers solubility on hGH; and ARR27101 is a tetrapeptide recognised by factor
                                                                                                                                                                                                                                                                                                         Mature polypeptide prodn. - by cleavage of soluble precursor using immobilised factor Xa\ (\mbox{Eng})
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Factor Xa linker DNA - used to construct fusion genes which can

                                                   The DNA in AAQ38417 and AAQ38418 encodes blood coagulation factor Xa recognition sequence IEGR (AAR32109). GA is added immediately after the CDS to form restriction enzyme NFUI recognition site. A DNA having inverted repeats of the first 11 nucleotides of the CDS is ligated to form a palindrome sequence of 22 nucleotide pairs.
                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is that of the factor Xa cleavage site which was used in the prepn. of a fusion protein comprising the epitope for the Ca++ dependent monoclonal antibody HPC-4 and a protein to be isolated. This fusion protein may be isolated using HPC-4-based affinity chromatography, the protein can be recovered in a single chromatographic step using immobilised HPC-4, and released from the fusion protein by cleavage with factor Xa.
                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fusion protein allowing rapid isolation of protein from soln. comprises desired protein and epitope recognised by monoclonal

The coding sequence was fused immediately dowstream of a region coding for a Factor Xa cleavage site (Ile-Glu-Gly-Arg), which was itself in-frame, within the chloramphenicol acetyl transferase (CAT) gene and downstream of a lac or tac promoter. Human CT can be recovered from the resulting CAT-(IEGR)-hCT fusion protein by cleavage with Factor Xa. The synthetic hCT could be replaced by sequences coding for other useful polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Prodn. of polypeptide in non-cellular protein synthesis system -
by constructing a fusion gene with chloramphenicol acetyl
transferase gene and opt. cleaving the polypeptide from the
resultant fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

It is used to exemplify a new expression
                                                                                                                                                                                            Novel recognition sites for cattle Factor-Xa are given in AAR0504 and AAR0606-12. Such sequences may replace the Factor-Xa recognition sequence (AAR0503) in recombinant fusion proteins to facilitate cleavage by a new serine protease (given in AAR0502).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
Refolding of polypeptide molecules - using a cyclic process involving denaturing and renaturing conditions to produce a correctly folded prod
                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Expression of heterologous proteins in halo-bacteria - urequlatory and stop sequences from halo-bacteria, pref. bacterio-rhodopsin gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     H. halobium bacteriorhodopsin protease cleavage site.
